Welcome to the foundation of how we think about and approach SEO. In this lesson, you'll learn the core principles that guide successful SEO strategies and understand the key differences between working with established versus non-established websites.

When it comes to ranking on Google, your website exists in one two distinct states:

Below the First Page (Positions 30+) If your site is on the 5th, 6th, or deeper pages of search results, your rank position depends heavily on traditional SEO factors:

- Quality and quantity of backlinks
- On-page optimization and content quality
- Site loading speed

First or Second Page (Positions 1-20) Once you've reached the first or second page for high-volume keywords, the game changes. Here, user experience becomes the dominant factor, with traditional SEO elements playing a smaller supporting role.

💡 **Key Insight:** Backlinks and content get you TO the first page. User experience keeps you there and moves you up.

The Backlink-Ranking Relationship

Research shows a clear correlation between referring domains and Google rankings. Sites ranking #1 typically have significantly more referring domains than those ranking #10. However, this relationship reveals several important principles:

Quality Over Quantity

While more referring domains generally correlate with better rankings, the quality of those links matters far more than sheer numbers. A handful of high-quality, relevant links will outperform thousands of low-quality spam links.

The 50% Rule

Statistical analysis shows that backlink strength (measured by metrics like Ahrefs UR) correlates about 50% with ranking position. This means:

- Backlinks represent approximately half of what determines rankings
- The other 50% comes from content, user experience, and other factors
- You cannot rely on backlinks alone

Domain Diversity Matters

Multiple links from different domains are more valuable than multiple links from the same domain. Google values diversity in your backlink profile as it suggests broader authority and trust.

Writing for Algorithms and Humans

Here's a critical truth: **Google cannot read.** It's an algorithm that processes signals and patterns. This means you must write content that:

1. **Clearly signals your topic** through strategic keyword usage
2. **Provides excellent user experience** through formatting, images, and design
3. **Demonstrates expertise** through comprehensive coverage

Essential On-Page Elements

- **Images:** Pages without images rarely rank well. Google knows users expect visual content.
- **Responsive Design:** Mobile-friendliness is non-negotiable
- **Fast Loading Times:** Speed directly impacts both rankings and user experience
- **Clear Structure:** Headers, paragraphs, and logical flow help both users and Google

The Age Factor

Domain and content age play a significant role in rankings:

- The average #1 ranking page is approximately 3 years old
- Less than 25% of top 10 results are under a year old
- Only 4% of pages in position 10 are less than a year old

⚠️ **Note:** New domains face an uphill battle. Setting realistic timelines is crucial for client retention.
