Keyword Research Philosophy

1.2x

5-min ⚡ 4 min 26 sec

Keyword research has fundamentally changed. Before ChatGPT and recent Google algorithm updates, we used to spend 4-5 hours meticulously analyzing keywords. Today, with AI assistance and the growing importance of topical authority, our approach is more streamlined and strategic.

🔑 **Key Insight:** Content creation is now inexpensive, allowing us to target more keywords without extensive deliberation. This shifts our focus from "*which keywords should we target?*" to "*how do we build comprehensive topical authority?*"

While keyword research remains important, it's no longer the cornerstone of SEO strategy. Here's what has changed:

- **Topical relevance** now carries more weight in Google's algorithm
- AI tools help us generate keyword variations quickly
- Content creation costs have dropped dramatically

Creating a Content Planner

AI-Rewriting Pages

Starting Point: Assessing Current Performance

When evaluating a website, your first step is to analyze their non-branded keyword traffic. Ask yourself:

- How much traffic comes from non-branded searches?
- What's their current domain rating?
- What competitive landscape are they facing?

Note: Branded keywords are easy to rank for—focus your efforts on non-branded opportunities that drive new visitors.

The One URL, One Keyword Rule

This is critical: **Each URL gets ONE target keyword.**

You cannot effectively optimize a single page for multiple keywords. While this might seem limiting, remember:

- One optimized keyword often ranks for multiple variations
- Similar queries tend to produce similar search results
- Your page will naturally capture related long-tail keywords

Example: Personal Injury Keywords

Consider "**personal injury lawyer**" vs. "**personal injury attorney**":

- Google sees these as nearly identical
- Search results are almost the same
- Ranking for one typically means ranking for both
- Add their search volumes together when evaluating opportunity

opportunity with combined search volume.

Managing Client Expectations

Clients often suggest keywords that are unrealistic for their current authority level. A common scenario:

- Client has a domain rating of 5
- They want to rank for keywords requiring a domain rating of 80
- They're not prepared to invest millions in link building

Your job is to find achievable targets that can build momentum and gradually increase their authority.

What We're Looking For

- **High volume** (relative to the client's niche)
- **Low competition** (appropriate for their domain authority)
- **Topical relevance** (builds subject matter expertise)
-

Context Matters

Volume is relative to your client's business:

- **High-value B2B:** 20-30 clicks/month might be excellent (if each client is worth \$50,000+)
- **E-commerce:** 10,000 clicks/month might be a rounding error

Always evaluate keyword opportunities within the context of your client's business model and revenue per visitor.

The Modern Approach: Quantity Over Perfection

1. **Cast a wider net** - Target all relevant keywords in your niche
2. **Build topical clusters** - Create comprehensive coverage of related topics
3. **Let Google decide** - Publish more content and see what performs
4. **Iterate based on data** - Improve what works, prune what doesn't

Remember: We used to agonize over keyword selection because content was expensive. Now, we can afford to be more experimental.

Calculating True Search Volume

When evaluating keywords:

1. **Identify similar queries** using Google's search results
2. **Add search volumes** for keywords that will likely rank together
3. **Calculate weighted average** of difficulty scores
4. **Make decisions** based on combined opportunity

This gives you a more accurate picture of the traffic potential for each content piece.
